

Wireless configuration of Senseca sensors and instruments.

SmartConnect

Introduction

Field configuration should be simple when sensors and devices are already installed, difficult to reach, or distributed across a site. This app gives users a wireless tool for configuring compatible Senseca sensors and devices, helping service and commissioning teams work directly where the device is used.

SmartConnect is developed for Senseca Germany GmbH devices and is positioned as a dedicated configuration app rather than a general monitoring tool. For acsportal devices, the current version adds two-factor authentication, supporting controlled access to connected device workflows.

The app store data safety information states that no data is collected and no data is shared with third parties. That makes the app a focused choice for users who need mobile device configuration with clear data handling information.
